Fraction Addition

Name: _____   **Date:** _____

> If the fractions both have the same **denominator**, it does not change.
>
> $$\frac{1}{4} + \frac{1}{4} = \frac{2}{4}$$
>
> Only add the top **numerator**.

Add to solve the problems below.

$$\frac{2}{5} + \frac{3}{5} = \frac{5}{5} \qquad \frac{3}{8} + \frac{1}{8} = \frac{4}{8} \qquad \frac{6}{9} + \frac{2}{9} = \frac{8}{9}$$

$$\frac{1}{3} + \frac{1}{3} = \frac{2}{3} \qquad \frac{2}{7} + \frac{4}{7} = \frac{6}{7} \qquad \frac{2}{4} + \frac{1}{4} = \frac{3}{4}$$

$$\frac{6}{8} + \frac{1}{8} = \frac{7}{8} \qquad \frac{3}{5} + \frac{1}{5} = \frac{4}{5} \qquad \frac{5}{10} + \frac{3}{10} = \frac{8}{10}$$

$$\frac{5}{12} + \frac{6}{12} = \frac{11}{12} \qquad \frac{4}{9} + \frac{2}{9} = \frac{6}{9} \qquad \frac{3}{7} + \frac{4}{7} = \frac{7}{7}$$

$$\frac{2}{11} + \frac{7}{11} = \frac{9}{11} \qquad \frac{2}{9} + \frac{3}{9} = \frac{5}{9} \qquad \frac{6}{8} + \frac{1}{8} = \frac{7}{8}$$
