

Multiplication:

Daily Specials

Directions: Write a multiplication sentence for each question.

Example: How much does it cost to buy 2 bottles of water? $2 \times \$4 = \8

1. How much does it cost to buy 3 bottles of water? $3 \times \$4 = \12

2. How much does it cost to buy 4 bottles of water? $4 \times \$4 = \16

3. How much does it cost to buy 4 baskets of strawberries? $4 \times \$5 = \20

4. How much does it cost to buy 5 baskets of strawberries? $5 \times \$5 = \25

5. How much does it cost to buy 3 pizzas? $3 \times \$6 = \18

If you paid \$12 for three bottles of water, show two ways to figure out how much you would pay for six bottles of water. Explain your thinking.

The students should show how you can either double \$12 as $(\$12 + \$12)$ to show that you will pay \$24 for six

bottles of water since six is twice as many bottles as three. Or they could show that you could also multiply \$12

by 2 to find that the total cost would be \$24. There are multiple ways to think through to the correct answer
