

New

Elements These elements have all been officially added to the Periodic Table of Elements since 2012. Ununtrium, Ununpentium, Ununseptium, and Ununoctium are the newest of these six and do not yet have official names. Their current names stand for their number – un (from Latin for one), pent (from Greek for five). Un-un-pent-ium has an atomic number of one-one-five (115). All of these elements are considered “artificial”, since they have only occurred in laboratory experiments, and have not been found in nature.
