Mount St. Helens, part of a line of snow-covered volcanic mountain peaks in the Pacific Northwest called the Cascade Volcanoes, was the site of a catastrophic eruption that occurred in 1980. The mountain showed activity for two months leading up to the fateful day it roared to life, after rumbling for nearly two months, the morning of May 18, 1980, seemed quiet and tranquil, it seemed as if the mountain had become dormant again. But at 8:32 a.m., a 5.1 magnitude earthquake beneath Mount St. Helens triggered a massive landslide that collapsed the sumr in an avalanche of debris and mudflows, hot ash, rocks, steam, and gases exploded from the volcano's newly exposed interior. The massive eruption spewed ash over hundreds of miles; destroyed homes, roads, and forests; and cost fifty-seven people their lives, it altere the landscape forever, cutting the peak down by about 1,300 feet and leaving an enormous, horseshoeshaped crater on the volcano's north side.		words or phr			fill in the bla		paragraphs.	moreover
